

Çlirim Misini

WEB DEVELOPER

Profile

In the high school i was studying mechanical engineering, especially technician for computer leadership which means transferring a piece of metal to something that clients wants through some codes that machine understand. After that I decided for further studying to go with programming and started my journey in Seavus. It was an amazing year with some hard times and good times obviously, but going through tons of homeworks and projects that we have through that year it really helped us a lot learning about programming.

As a junior I want to start in any field to begin my journey on programming world and i'm ready to work and give everything that I know with everyone I work, collaborating with teams, learning more new technologies that are coming up, adapting to different ways of working, meeting and communicating with new people.

Employment History

Frontend Web Developer, Freelance

APRIL 2021

It's a great experience working on different projects, working with multiple people and building interesting projects for specific reason to help fill people's needs.

Software Developer, Rex Solution, Skopje

JANUARY 2022 – JUNE 2022

Started working in January, which I started as a **Software Developer** especially with Front End, where I started working on big projects and being independent, where I did the Front End part with React Native for mobile applications. It was a good experience to work on a team, to take the tasks, to work under pressure and have daily or weekly meetings with the team to discuss about the further development process of the application

Education

Web Developer, SEDC - Seavus Education and Development Center, Skopje

NOVEMBER 2020 – NOVEMBER 2021

It was definitely a challenging year but also an interesting one learning new and different stuff. In the first couple of months we learned front end especially HTML5, CSS3, JavaScript, working on structure of web content, styling them and making them functional, also worked on the project for front end part that gave me a feeling on how companies work, how teams define their work on who's going to do what, to work under pressure, with time limit.

After that we started with NodeJS, creating servers, making the front end part dynamically using a NodeJs framework ExpressJS with set of features for web and mobile applications.

Then we learned about databases like SQL, MongoDB continuing with ReactJS and AngularJS which was so good to learn to build front end applications more faster.

In the last month we learned MEAN/MERN that helped us connect all technologies that we learned in one application
